

【Abstract of the disclosure】

This invention is a "Wireless local network financial system facility". It is device for identifying the real identity of a person and thus to prevent credit card frauds. The system consists of a card access portion, two palmprint-identifying portions and a wireless local network card. When a user withdraws cash through the card access portion, the palmprint data of the user will be identified at the same time. Besides, the data will be sent to a financial center database to identify the identity of the user. Only the check is approved, the procedure of card access and withdrawing cash just can be finished. Therefore, the rights and the liabilities of stores and banks can be secured, and all meaningless loss can be protected.
